

Buttons

There are 3 main button types described in material design. The raised button is a standard button that signify actions and seek to give depth to a mostly flat page. The floating circular action button is meant for very important functions. Flat buttons are usually used within elements that already have depth like cards or modals.

Raised

Floating

Floating Action Button

See the documentation on [this page](#).

Flat

Flat buttons are used to reduce excessive layering. For example, flat buttons are usually used for actions within a card or modal so there aren't too many overlapping shadows.

Submit Button

When you use a button to submit a form, instead of using a input tag, use a button tag with a type submit

Large

This button has a larger height for buttons that need more attention.

Small

When mouse and keyboard are the primary input methods, this smaller button is useful for denser UI layouts.

Disabled

This style can be applied to all button types
